TREE PEONIES, A Millionaire's Flower. Imagine their glowing colorful beauty, the rich dignity—that these elegant Tree Peonies will bring to your home. But today, thanks to this offer, you can plant these oriental beauties lavishly, because they are yours for only a fraction of their former price.

SEEDS of HARDY FLOWERS— PERENNIALS AND BIENNIALS

HOW TO GROW THEM. Hardy plants (perennials) bloom the second year from seed and are permanent thereafter. Some of them may bloom the first year if the seed is sown very early. Among the perennials we find some of the most beautiful flowers for cutting and many of the old-fashioned sorts dear to our childhood memories. A hardy border properly planned and planted is a source of joy from early spring to late autumn, during that period it will be resplendent with color and yield an abundance of bloom for indoor decoration. The plants need little attention other than to be kept free from weeds and given an occasional top-dressing of plant food.

WHEN TO SOW. Seed may be sown in hotbed in February or March, or out-of-doors from the first days of May to mid-August.

It is well to sow as early as possible, thus permitting the plants to become strong and well established before winter.

WHERE TO SOW. For most perennials a cold frame is an ideal place for starting seeds, but if you do not have one, make a seed-bed of finely sifted light soil, adding and mixing thoroughly well-decayed manure, humus, or prepared plant food. Sow the seed in shallow drills, covering $\frac{1}{8}$ " or more, according to the size of the seed, but very fine seed should only be lightly pressed into the soil.

CARE OF SEEDS AFTER SOWING. Press down the bed with a flat board, and water gently but thoroughly with a fine spray. Do not permit the soil to become dry while the seed is in process of germination, for until the plant develops roots its life depends entirely on moisture. Nearly all failures in growing perennials may be attributed to drying in the seed-bed, which should be carefully watched and watered until the plants have made four to five leaves.

Hardy Water Lilies can be set any time from May 1st until the end of August, but tender Lilies not before June. Order early.

A simple way to plant Water Lilies is on rich soil in boxes 2 feet square and 1 foot deep. Cow manure is the best fertilizer but commercial fertilizers can be used. Place one Water Lily root in each box, cover the crown of the plant, then cover with 1 inch of sand or gravel, to prevent discoloration of the water, and sink the boxes in the pond.

Max Schling's Cutting and Bedding Flower Garden Mixture

It is our wish that we would have sufficient space to list all of the testimonials that we have received in praise of this marvelous seed value. We have received reports from all sections of the country extolling the beauty and practical results obtained from sowing this mixture. Carefully blended to strike a perfect balance between the showy bright annuals and those of more subdued tendencies, the result provides a bold effect where required and a vista of real beauty covering large areas where it would be impossible to intensely cultivate a garden. Left to themselves, the vigorous hardy annuals in this mixture self-sow and it can be safely said that a wild garden produced from this seed will be more or less permanent.

NEW ALL DOUBLE SNAPDRAGONS

We consider this outstanding strain of 100% fully double snapdragons to be the most exciting introduction in the past ten years of floriculture. Flowers are huge and produced far earlier than other types of Snapdragons. Excellent both for cutting and for the garden, where they replace stocks in areas where this latter cannot be grown satisfactorily. Also, eminently suited for greenhouse culture.

Be the first in your neighborhood to grow these exciting, brand new sensations!

TIPS ON SNAPDRAGON CULTURE

Antirrhinum (Snapdragon) seed should be started in flats early in the spring. Care should be taken not to plant the seed too deeply, or to over-water. When plants are large enough to handle, they can be pricked off into 2½" pots and hardened in the cold frame for later transplanting.

Seeds may also be sown directly in the open soil and then thinned out, leaving seedlings about a foot apart.

Snapdragons are a hardy annual and excellent results may be obtained by fall sowing.

MAGNIFICENT PETUNIAS

No flower is so popular as the Petunia. They have captivated the hearts of all gardeners, amateur and professional, and have supplanted a great many of the old favorites such as Geraniums, Salvias, Vincas, etc., as bedding and window box plants. Only lately have Petunias been recognized as splendid cut flowers. They are so prolific that proper culture requires frequent trimming of the plants so that cutting the blooms not only provides a splendid source of cut flowers, but aids the general growth of the plant as well. Petunias are impartial. They will grow anywhere, in semi-shade or in hot, dry sunny locations. The list as represented below embraces the finest selection of Petunia varieties that have been tested for their beauty, prolific bloom, and excellent growing habits.

CULTURE: Beans grow well in any good garden soil. Usually the first planting can be made the last week in April, followed by successive plantings about 2 weeks apart until August 15. Open a drill 2 inches deep and drop the Beans 1 inch apart and cover. When well up, draw the soil up against the plants and cultivate frequently. Do not cultivate them when the dew is on the plants as this frequently causes rust. One pound of seed is sufficient for 50 feet of drill.

BOUNTIFUL. Stringless; surpasses in crisp, tender qualities and fine flavor. (47 days).

Plant in rows 3 feet apart in the row, always edgewise with the eye down.

FORDHOOK. Best for the home garden, very productive and of rich buttery flavor. Large, round and plump. (71 days.)

BEANS

(Pole Limas)

Where poles can be secured, these Beans are more productive than the Bush varieties. Set Poles 3 feet apart, enrich the soil in the hills by mixing with a liberal supply of sterilized or well-rotted manure. Do not plant until the ground is warm. One pound will plant 50 poles.
